# LAGUN TABLE LEG SYSTEM

#### 2. TABLETOP SELECTION:

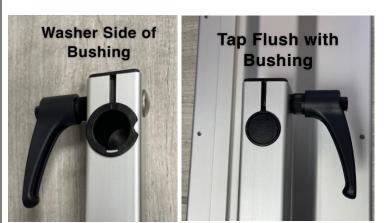

- The system can support up to 50 lbs of weight. This includes the weight of the tabletop plus anything placed on it.
- Maximum tabletop size 30" x 40".
- Minimum thickness: 5/8".

#### 3. TABLETOP INSTALLATION:

- Flip the tabletop upside down to install the table mounting plate to the underside of the tabletop.
- Install the table mounting place as centered as possible. <u>NOTE</u>: Screws must be installed at least 1/2 the depth of the tabletop for stability reason, using caution so they don't protrude through the tabletop.

## 4. SYSTEM ASSEMBLY:

- Loosen handles on arm. Install the arm on the table mounting plate by sliding it over the splined tap. (You may have to move it back and forth). <u>NOTE</u>: Make sure the splined tap from the table mounting plate is fully inserted, so it is flush with the bushing on the arm. (See PHOTO 2) The washer side of the bushing must face towards the splined tap. (See PHOTO 1) Tighten handle.
- Repeat on the other end of the arm to install the arm onto the leg.
- Once all pieces are assembled, handles on the arm are tightened, flip system upright. <u>NOTE</u>: Make sure handles are repositioned.
- Loosen handle(s) on leg. Slide the leg onto the bracket and tighten leg handle(s) to secure in place. The bracket needs to be within the slotted grove on backside of leg. (SEE PHOTOS 3 & 4) NOTE: This step may require 2 people.
- When adjusting the height of the system, at least 1 inch of the slotted leg groove must be tightened onto the bracket. The more of the leg groove tightened to the bracket, the more stable the system.

# Caution!

Do not overtighten handle. It can cause thread damage, causing the handle to seize, which is not covered under warranty.

If desired, anti-seize for stainless steel may be applied.
